# STYLELITE® POLISHING & SURFACE HARDNESS

StyleLite® is the ultra high gloss acrylic lamination product for all door, drawer or furniture construction, - and with its mirror-like appearance it will really turn heads.

StyleLite faced laminated boards are supplied ready to fabricate and feature a tough, protective masking film.

The masking film should only be removed once the fabrication and installation is complete.

When the film is removed a small amount of invisible adhesive residue is left behind and we recommend this residue is removed by lightly buffing with a suitable plastic polish.

This initial polishing process also provides additional protection to the surface from scratching or scuffing.

All quality brands of acrylic faced high gloss decorative sheet get harder and more

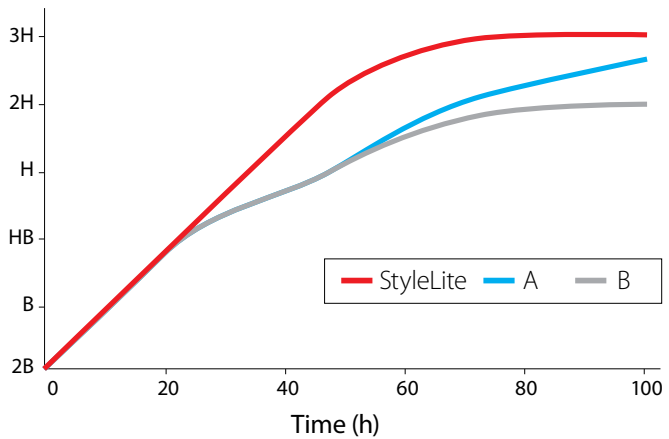

scratch resistant over the first few days of exposure after the masking film is removed.

When compared to other leading brands StyleLite achieves the 2H level of scratch resistance 40% faster. StyleLite achieves the superior 3H hardness level in only 3 days after initial polish.

The StyleLite high gloss surface becomes more scratch resistant over the first few days after the protective film is removed.

This process can be accelerated by an initial polishing procedure which will ensure the maximum scratch resistance is achieved in the shortest possible time. For best results we recommend the following polishes: Vuplex, Novus #1 ultra gloss super polish, Plexus plastic polish.

StyleLite is harder, more scratch resistant, and ultra high gloss - Plus being able to cure faster than other products makes StyleLite the ideal lamination panel for all your decor needs.

StyleLite is harder, more scratch resistant, & ultra high gloss which makes it the ideal lamination panel for your decor needs

REMOVE FILM

SPRAY PLASTIC POLISH

RUB

INCREASED HARDNESS
